

Insect bat's flight area:
15' x 33' x 7' high

Fruit bat's indoor flight enclosure:
26' x 38' x 7' high.

Semi-outdoor flight area for fruit bats:
32' x 42' x 7.5 high.

Skylights and sun tubes will provide year-round natural light inside the flight enclosures. During temperate weather, two 14' bay doors will be opened to provide an outdoor experience for the bats while they remain protected under the roof. Bay doors will be covered with security gates and transparent zoo mesh to prevent mice and wildlife from entering the building during nights when the bay doors remain open. During harsh weather (approx 3 months out of the year), the door to the semi-outdoor flight enclosure will be closed so bats remain inside the indoor flight cage. All flight enclosures will contain simulated natural habitat.

= double-door entryways
